- o Recap
- o Matrix Factorization
- o TRF in PCA
- o SVD

Factorization

Let's say we have a number 42

Questions

Can we decompose this number into product of its another smaller numbers?

$$A_{n \times m} \Rightarrow B_{n \times d} \bullet C_{d \times m}$$

$$A_{n \times m} \Rightarrow B_{n \times d} \bullet C_{d \times k} \bullet D_{k \times m}$$

So, How do we find these U and I matrix such that $A = U \bullet I^{\text{Transpose}}$

$$\begin{array}{c}
 \begin{array}{c} I_1, I_2, I_3, \dots, I_m \\
 \left[\begin{array}{c} c_1 \\ c_2 \\ \vdots \\ c_n \end{array} \right] \\
 \begin{array}{c} \boxed{D_1, D_2, D_3} \\
 \boxed{\text{Nul}} \end{array} \end{array}
 \end{array}
 \Rightarrow
 \begin{array}{c}
 \begin{array}{c} c_1 \\ c_2 \\ c_3 \\ \vdots \\ c_n \end{array} \\
 \left[\begin{array}{c|c} d & \dots d \\ 0 & 0 \end{array} \right] \\
 \begin{array}{c} d \\ \vdots \\ d \end{array} \\
 n \times d
 \end{array}
 \begin{array}{c}
 \begin{array}{c} m_1, m_2, \dots, m_m \\
 \left[\begin{array}{c} 0 \\ 0 \\ 0 \end{array} \right] \\
 d \times m
 \end{array}
 \end{array}$$

U matrix can be interpreted as containing User information

Item matrix can be interpreted
as containing item information

Hypothesis:

$$A_{ij} \Rightarrow U_i \cdot I_j$$

For ex:

The Rating User 2 will give
to item 3 can be calculated
as

$$P_{23} = U_2 \cdot I_3$$

SS
 A_{23}

MSE

$$\sum_{i,j} (A_{ij} - U_i \cdot I_j)^2$$

S.t. $A_{ij} \neq \text{Null}$

output from
interaction

* SGD to find value of U_i and I_j

Step 1: Initialize matrix U and Matrix I randomly

Step 2: Take derivative of loss and update U and I

* We calculate loss only for values where user has given some ratings

Alternative: Co-ordinate Ascent / Descent Algorithm

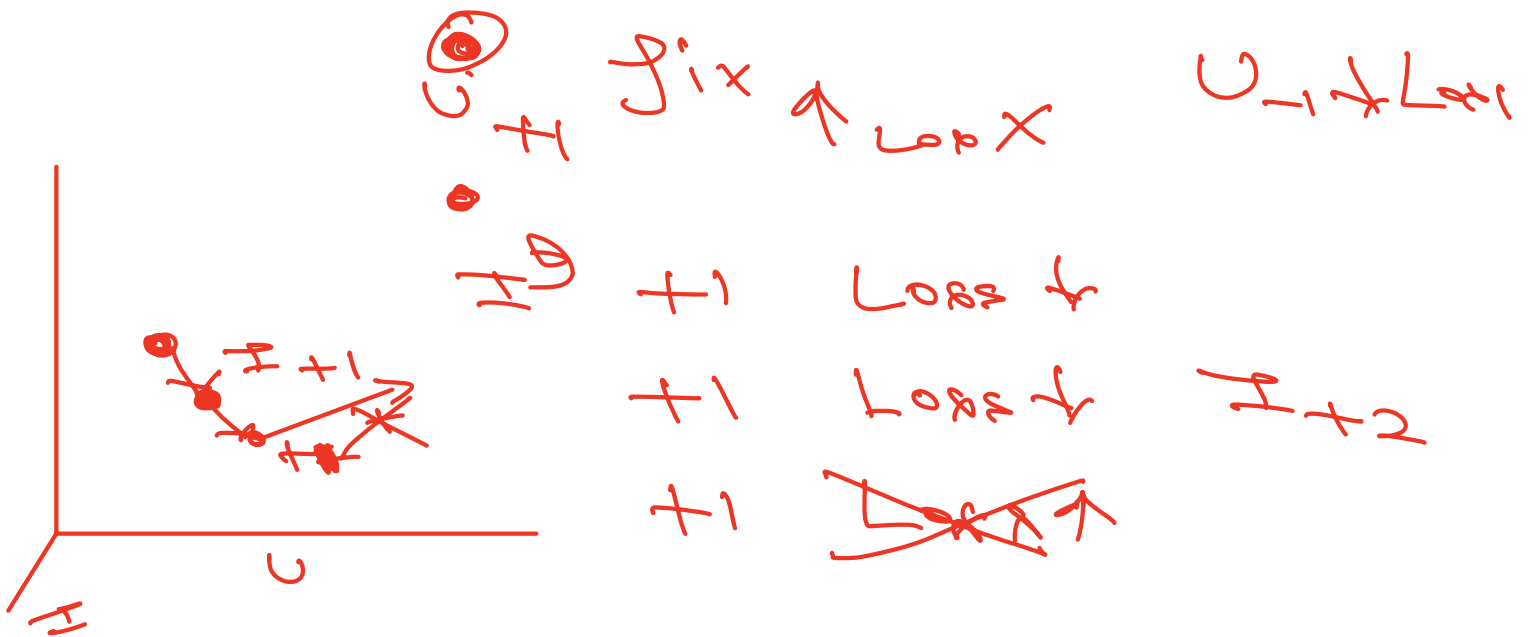

① Random initialization

② Calculate Loss

③ We fix value U for some iteration and update I such that loss Reduce

- ④ After few iteration freeze U and update I
- ⑤ Repeat until Convergence

Alternate Least Square

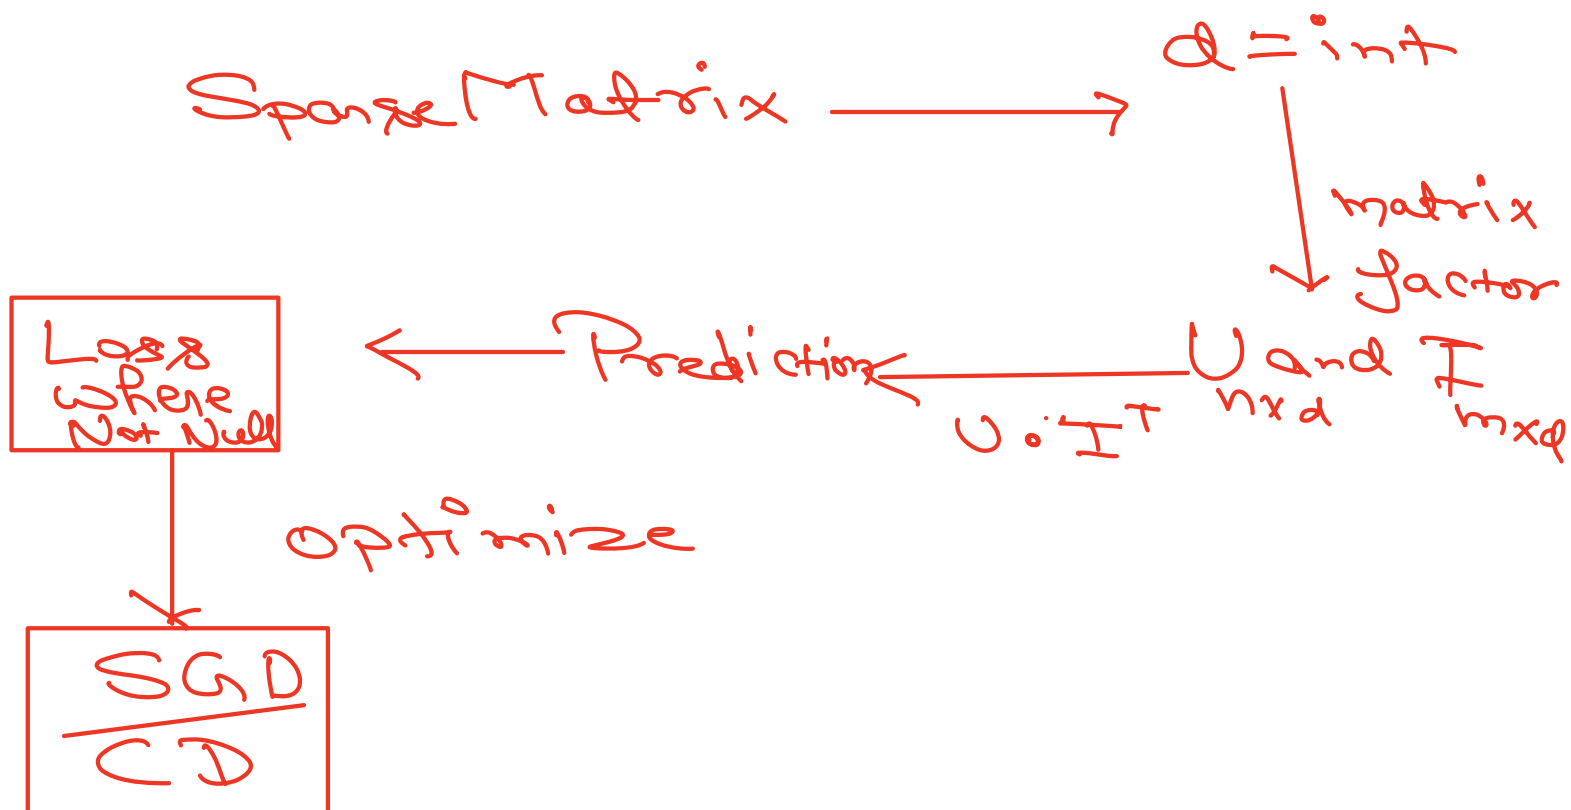

$$P_{ij} = U_i \cdot I_j$$

Containing Interaction
info about
User i

Containing
info about
ratings
item j

* Issue with this

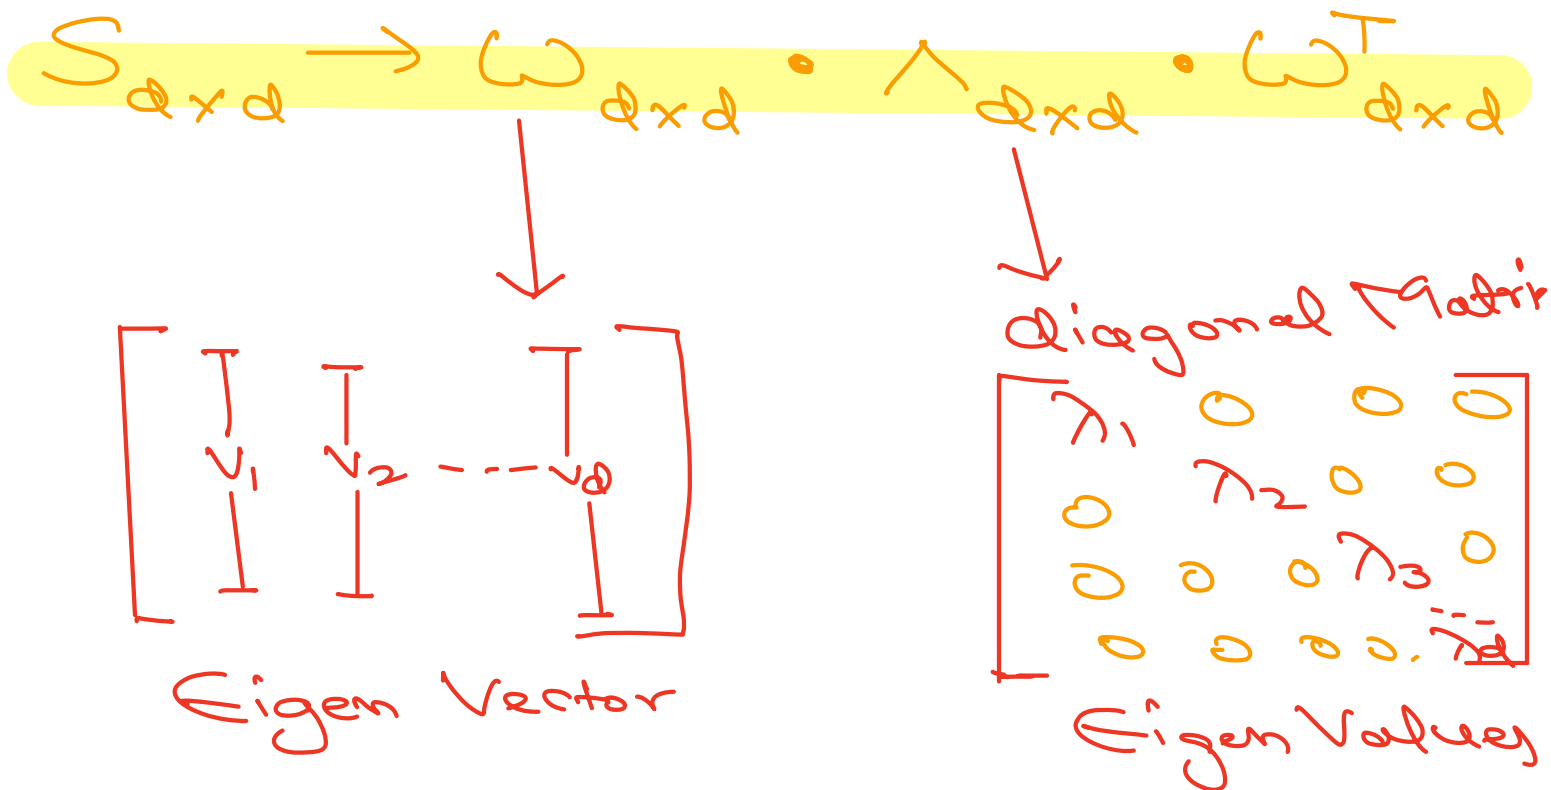

A new User or User that never rates

MF in PCA

$E \cdot V \cdot D$: Matrix Needs to Square

* Special case of MF

* Constraint 1 : V 's are Orthogonal's

* Constraint 2 : Λ is diagonal

SVD

$$X_{n \times d} \Rightarrow U_{n \times n} \Sigma_{n \times d} V_{d \times d}^T$$

$$\begin{bmatrix} \updownarrow & \updownarrow & \dots & \updownarrow \\ u_1 & u_2 & \dots & u_n \\ \updownarrow & \updownarrow & \dots & \updownarrow \end{bmatrix}_{n \times n}$$

$$\begin{bmatrix} \updownarrow & \updownarrow & \dots & \updownarrow \\ v_1 & v_2 & \dots & v_d \\ \updownarrow & \updownarrow & \dots & \updownarrow \end{bmatrix}_{d \times d}$$

Singular Value

$$\begin{bmatrix} s_{11} & & & \\ & s_{22} & & \\ & & \ddots & \\ & & & s_{nd} \end{bmatrix}_{n \times d}$$

$$s_i \Rightarrow \sqrt{\lambda_i}$$
